Gas and heating fittings

Gas ball valves

Perfect regulation and complete safety. Gas ball valves from SCHELL simplify the use of gas and provide the necessary safety. A high thermal capacity and an integrated thermostatically actuated shutoff valve (TAS) typify the gas connection ball valves.

Gas excess flow valve

A reliable monitor for your household. The gas excess flow valve provides protection against manipulation or large-scale leaks and thereby fulfils the requirements of TRGI 2008. It is installed upstream and downstream from the gas pressure control device.

Fill and drain fittings

These fittings can be used in a multitude of situations within the world of heating technology. For example, heating systems, separate pipe section or even individual heating units can be filled with water and then drained again.

Radiator connections

SCHELL has a wide range of radiator connections for compact and valve radiators. The fittings are available in angled or straight form and suitable for both copper and steel pipes as well as installation systems.
